

How to Import Quiz Questions from Excel

You can easily upload many quiz questions at once using an Excel file instead of adding them one by one. Follow these steps carefully to make sure everything works correctly.

Step 1. Prepare Your Excel File

Create an Excel file (.xlsx or .csv) that looks like this:

question	question_type	correct_answers	option_a	option_b
What is 2+2?	single_choice	A	4	5

👉 Each row = 1 question

Step 2. Required Columns

Your file must include these columns (otherwise import will fail):

Column	What it means	Example
question	The actual question text	What is 2+2?
question_type	The type of question	single_choice / multiple_choice / text
correct_answers	The correct answer (use A, B, etc. for options)	A
option_a	First option	4
option_b	Second option	5

✅ Without these columns, the import will stop and show an error.

Step 3. Optional Columns

You can also add these if you want:

Column	What it means	Example
option_c / option_d	More answer options	6 / 7
score	How many points this question gives	5
time_limit	Time allowed (in seconds)	30
order	Question order number	1
level	If your quiz has Level, then enter Level title exactly as your level table have.	Level 1

explanation_type	How the explanation appears	text / image / video
explanation	Explanation of the question	Paris is capital of France
hints	Tips to help answer	Think about Europe
answer_explanation	Why the correct answer is correct	Paris is correct because...

Step 4. About “Question Type” and “Explanation Type”

These two fields must have specific values:

Question Type:

- single_choice – only one correct answer
- multiple_choice – several correct answers allowed
- true_false – true or false type
- fill_in_the_blank – short text answer

Explanation Type:

- text – normal written explanation
- image – image-based explanation
- video – video explanation

 If you type something else (like “txt” or “word”), it will not work.

Step 5. If Your Quiz Has Levels

If your quiz has levels (like Easy, Medium, Hard), you must include the 'level' column in your Excel file. If the level name doesn't exist yet, the system will automatically create it. If your quiz does not use levels, you can leave the column out.

Step 6. How Options Work

Each option (A, B, C, D) becomes part of the question. When you select the correct answer in the “correct_answers” column, use the option letter (A, B, C, etc.).

Example:

question: What is 2+2?

option_a: 4

option_b: 5

correct_answers: A

 This means Option A (4) is correct.

Step 7. Common Errors

If something is missing or wrong, you might see these messages:

- “Row #2 has no question” → You forgot to write a question.

- “Invalid question type” → You used a wrong type (like ‘choice’ instead of ‘single_choice’).
- “Invalid explanation type” → You used an invalid explanation type (like ‘txt’).
- “One of the row has no level” → The quiz uses levels but your Excel is missing the “level” column.

If this happens, fix the Excel file and try again.

Step 8. Uploading the File

1. Go to your Quiz Import section in the admin panel.
2. Select the quiz you want to add questions to.
3. Click 'Import Questions' or 'Upload File'.
4. Choose your Excel file and click 'Submit'.

The system will read the file, check everything, and add all valid questions.
If everything is fine, you’ll see a success message.

Done!

Your quiz questions are now imported and ready to use. You can edit or preview them from your Quiz Questions page in the admin panel.
